Pred. No. 1s the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A probe (AAQ73433) or its complement (AAQ73436) and corresponding RNA sequences (AAQ73437 and AAQ86436) used for the specific detection of all strains of Histoplasma capsulatum (H.C.). The probes are manufactured complementary to the H.C. 18s rRNA or rDNA gene. This region also corresponds to the bases 172-193 of Saccharomyces cerevisiae 18s rRNA. The probe is specific for H.C. and can be used to distinguish the fungus from all others, even its nearest phylogenetic neighbour Blastomyces dermatitidis. Nucleic acid hybridisation of the specific probe is enhanced by the use of helper probes (AAQ73434-5). This method allows the detection and/or the quantitation of H.C. from samples e.g. body

The present invention describes a method for monitoring differential CC expression of genes in a first filamentous fungal (FF) cell relative to CC expression of the same genes in one or more second filamentous fungal CC cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTS CC are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes CC in a first filamentous fungal (FF) cell relative to expression of the ESTS composition of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be composited and gene copy number variation and stability can be discovered, possible functions of unknown open reading frames can be comploogenesis, recombination, metabolic or catabolic pathway composition comploogenesis, recombination, metabolic or catabolic pathway composition composition of genes conditions, environmental stress, spore compinedering. Using ESTS provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open readding frame, and organisation of the composition of the results. AAPO1478 to AAF11873 represents ESTS from Aspergillus organism to AAF11878 represents ESTS from Aspergillus organe; and composition of AAF11873 represents ESTS from Trichoderma reesel, which are cc all specifically claimed in the present invention.

                                                                                                                                                                                                                                                                                                                                                                                               engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF11247 represents ESTs from Aspergillus Pusarium venenatum; AAF11248 to AAF11853 represents ESTs from Aspergillus oryzae; and AAF11879 to AAF11879 represents ESTs from Aspergillus oryzae; and AAF14879 to AAF1875 are seen to Trichoderma reesei, which are all specifically claimed in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative texpression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The EST
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fusarium venenatum

 The present invention relates to a new microbe of Acinetobacter or Burkholderis genus producing aldonic acid and oxidising specifically the hemiacetal hydroxy group of a saccharide having said hydroxy group. Aldonic acid is used as a mineral reinforcing agent. The present sequence was used to illustrate the present invention.

The process can bused to detect or identify microbes rapidly and exactly.

                                                                                                                                                                                                           This sequence represents a genomic DNA sequence containing the 18S rRNA gene, internal transcribed spacer regions I and 2 [ITS1, ITS2] and 5.8S rRNA sequences from a mutant strain of Gibberella fukikoroi (LTB-1027) of the invention. This region of DNA is highly variable and can be used for species and strain differentiation. The LTB-1027 mutant produces a mixture of gibberellins which is at least 70 % GA_4 and GA_7. Gibberellins GA_4 and GA_7 promote flowering and fruit cell elongation, and are used by growers of apples, pears and grapes to produce larger fruits and earlier harvests. The mixture of GA_3, GA_4 and GA_7 achieved using the method of this invention should be particularly useful in the apple industry where GA_4 has been found more effective in russet control and in promoting fruit set. This method produces GA_4 and GA_7 in much higher titers than prior art methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        misc_feature
                                                                                                                                                                                                                                                                                                                                                                                             A new method for producing a mixture of gibberellins from Gibberella fujikuroi results in high titers of GA4 and GA7 useful to promote flowering and fruit growth in the fruit growing industry – \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for monitoring differential CC expression of genes in a first filamentous fungal (FF) cell relative to CC expression of the same genes in one or more second filamentous fungal CC cells. The method uses fluorescence-labeled nucleic acids isolated from CC the FF cells and a substrate of expressed sequence tags (EST). The ESTS CC are used in the methods for monitoring differential expression of genes CC in a first filamentous fungal (FF) cell relative to expression of genes CC in a first filamentous fungal (FF) cell relative to expression of the CC same genes in one or more second filamentous fungal cells. Monitoring CC the global expression of genes from FF cells allows the production CC potential of the microorganisms to be improved. New genes may be CC discovered, possible functions of unknown open reading frames can be comploated. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore CC morphogenesis, recombination, metabolic or catabolic pathway CC engineering. Using ESTs provides several advantages over genomic or carray equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate CC analysis of the results. AMF01748 to AMF11247 represents ESTs from Aspergillus of the provides and the results. AMF01748 to AMF11253 represents ESTs from Aspergillus oryzae; and CC AMF14879 to AMF15337 represents ESTs from Trichoderma reeset, which are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method for detecting Aspergillus nucleic caid (I) in a body sample which comprises the isolation of (I) followed by a two-step polymerase chain reaction (PCR) amplification of any nucleic acid having a sequence essentially homologous to part of the 3 'rend of the Aspergillus 18S rRNA gene using primers used in the first step that do not overlap with those in the second step. The method is used for early diagnosis, and monitoring, of aspergillusis, particularly invasive infections in hematological-oncological patients with long-term overlapping primers, this process provides efficient and reliable overlapping primers, this process provides efficient and reliable detection of Aspergillus in clinical situations. It is specific for Aspergillus (It detects the species terreus, niger, versicolor, clavatus, Clavatus, and funigatus, but not oryzae, nor bacteria or fungi from any cother genera). This sequence represents the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence of Aspergillus to the constant of the DNA sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a new microbe of Acinetobacter or Burkholderis genus producing aldonic acid and oxidising specifically the hemiacetal hydroxy group of a saccharide having said hydroxy group. Aldonic acid is used as a mineral reinforcing agent. The present sequence was used to illustrate the present invention.
                                                                                                                                                                                                                                                                                                                                                                                    WPI; 1998-535049/46.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score
